Model-Driven Architecture: Research objectives

Main objective of the research is to construct a MDA technology based on nowadays system modeling visual languages (SysML, UML, BPMN, CMMN) and existing Semantic Web vocabularies and technologies. The following techniques and software are under development:

1. CIM representation with SysML, BPMN, CMMN, and results of source code processing,
2. CIM, PIM, PSM representation in UML, RDF with existing vocabularies,
3. transformation implementation with logical language Logtalk,
4. usage of LOD sources in transformations for obtaining additional semantic data,
5. generation of documents and user interfaces with LOD markup.

研究的主要目标是基于当今的系统建模可视化语言（SysML、UML、BPMN、MDA 技术。以下技术和软件正在开发中

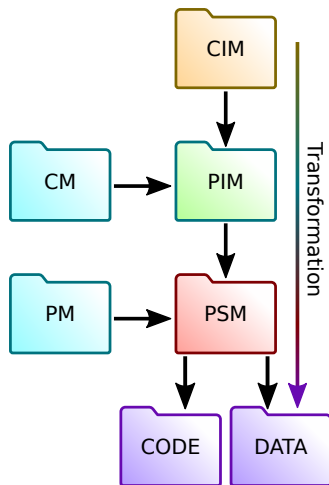

1. 用 SysML、BPMN、CMMN 和源代码处理结果表示 CIM、
2. 用 UML、RDF 和现有词汇表表示 CIM、PIM 和 PSM、
3. 使用逻辑语言 Logtalk 实现转换、
4. 在转换中使用 LOD 源以获取额外的语义数据、
5. 使用 LOD 标记生成文档和用户界面。

CODE 软件源代码;

DATA 初始数据库状态。

Logtalk as transformation definition language

We have chosen Logtalk as it

- ❑ inherits widely known Prolog language syntax and runtime;
- ❑ is implemented as macro package, performance penalties are about 1.5%;
- ❑ has flexible semantics: we can define transformations and constraints within the same syntax;
- ❑ implement object-oriented knowledge (rules) structuring, encapsulation and replacement;
- ❑ compositional way of transformation implementation;
- ❑ powerful engine to post constraints on object-to-object messages (events);
- ❑ has implementation for various Prolog engines.

The «regular» language allow us to use its libraries not directly related to MDA transformations.

Logtalk 作为转换定义语言

我们选择Logtalk是因为它

- ❑ 继承了广为人知的 Prolog 语言的语法和运行时；
- ❑ 作为宏包实现，性能损失约为1.5
- ❑ 具有灵活的语义：我们可以在相同的语法中定义转换和约束；
- ❑ 实现了面向对象的知识（规则）结构化、封装和替换；
- ❑ 实现转换的组合方式；
- ❑ Logtalk是一个强大的引擎，可以对对象到对象的消息（事件）发布约束；
- ❑ 为各种Prolog引擎提供实现。

这种常规语言允许我们使用它与 MDA 转换没有直接关系的库。

Linked Open Data, LOD

1. Information is published in Internet with open access license;
 2. It is represented in a machine-readable form, e.g., Excel table instead of a bitmap picture;
 3. An open format used, e.g., CSV instead of Excel;
 4. The format is based on W3C recommended standards, allowing RDF and SPARQL reference;
 5. Published data refer to objects, forming context.
- Thus, applications publish data as relations of objects (entities).

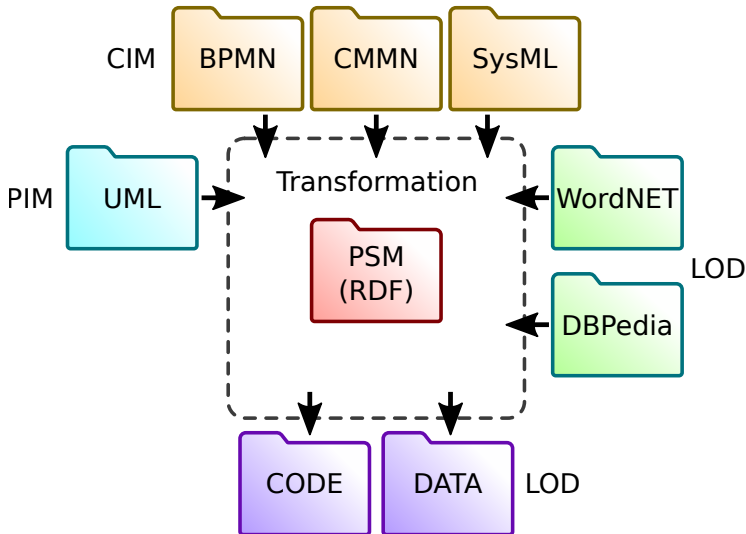

Linked Open Data, 关联开放数据, LOD

1. 信息在互联网上发布，采用开放式获取许可；
2. 它以机器可读的形式表示，例如 Excel 表格，而不是位图图片；
3. 使用的开放格式，如 CSV 而非 Excel；
4. 该格式基于 W3C 推荐的标准，允许引用 RDF 和 SPARQL；
5. 发布的数据指代对象，形成上下文。

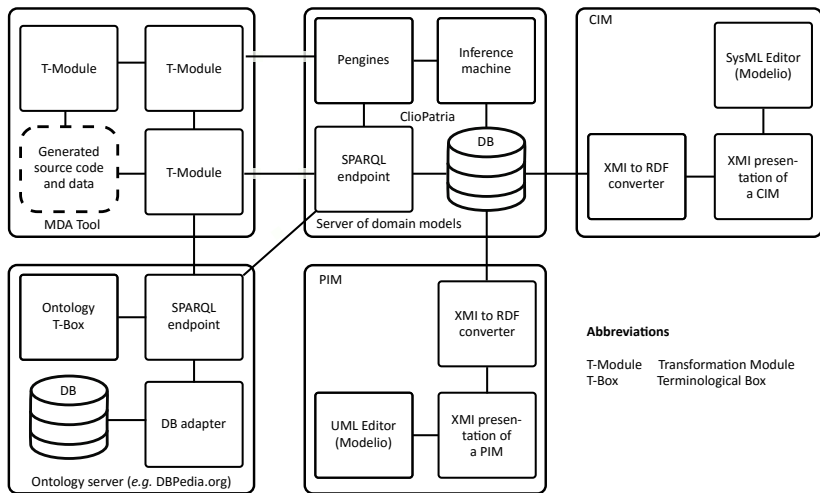

因此，应用程序以对象（实体）关系的形式发布数据。

% .....
```

Interesting positive impressions obtained:

- ❑ Logtalk and RDF are flexible, sufficiently universal and convenient implementation infrastructures for MDA;
- ❑ The best implementation means is Prolog predicate wrapping and Logtalk object encapsulation of rules;
- ❑ Not all Logtalk properties are investigated: there might be more sophisticated programming techniques developed, e.g., on the base of message watchers.

Technical problems making the approach somewhat problematic:

- ❑ Very simple tasks take too much efforts, e.g., text processing: convert an identifier into the CamelCase;
- ❑ It takes too long to surf Internet in order to find a vocabulary for a domain, but it is more productive than development;
- ❑ Prolog is not a popular language in MDA, neither Logtalk.

有趣的正面印象:

- ❑ Logtalk 和 RDF 是灵活、足够通用和方便的 MDA 实现基础架构;
- ❑ 最好的实现手段是对规则进行Prolog谓词封装和Logtalk对象封装;
- ❑ 并非所有的Logtalk属性都得到了研究: 在消息监视器的基础上, 可能会开发出更复杂的编程技术。

技术问题使得这种方法有些困难:

- ❑ 非常简单的任务就需要花费太多精力, 比如文本处理: 将标识符转换成 CamelCase;
- ❑ 为了找到一个领域的词汇而上网太花时间了, 但这比开发更有成效;
- ❑ Prolog在MDA中并不流行, Logtalk也不是。

Document authoring and storage

In most cases documents are created as a result of

- ❑ creative activity of a person with a text processors (authoring);
- ❑ printing a digital copy or a data record in a database;
- ❑ aggregation operation over database records (report).

Then it is stored either as a physical paper and/or a digital document (PDF, DOCX, HTML).

Since 2000-th, Semantic Web and Linked Open Data (LOD) is being developed, allowing

- ❑ structural storage of data within published documents;
- ❑ processing stored data computationally;
- ❑ integration of data structures and data objects globally.

The aim of this research is to develop technologies, software and services allowing construction of digital archives supporting document data inclusion and inference from existing documents.

Document authoring and storage, 文件编写和存储

在大多数情况下，创建文档的结果是

- ❑ 文本处理人员的创造性活动（创作）；
- ❑ 打印数字副本或数据库中的数据记录；
- ❑ 对数据库记录进行汇总操作（报告）。

然后

以实体纸张和/或数字文档（PDF、DOCX、HTML）的形式存储。

自2000年以来，语义网（Semantic Web）和关联开放数据（Linked Open Data, LOD）得到了发展，从而可以

- ❑ 在已发布的文档中以结构化方式存储数据；
- ❑ 计算处理存储的数据；
- ❑ 在全球范围内整合数据结构和数据对象。

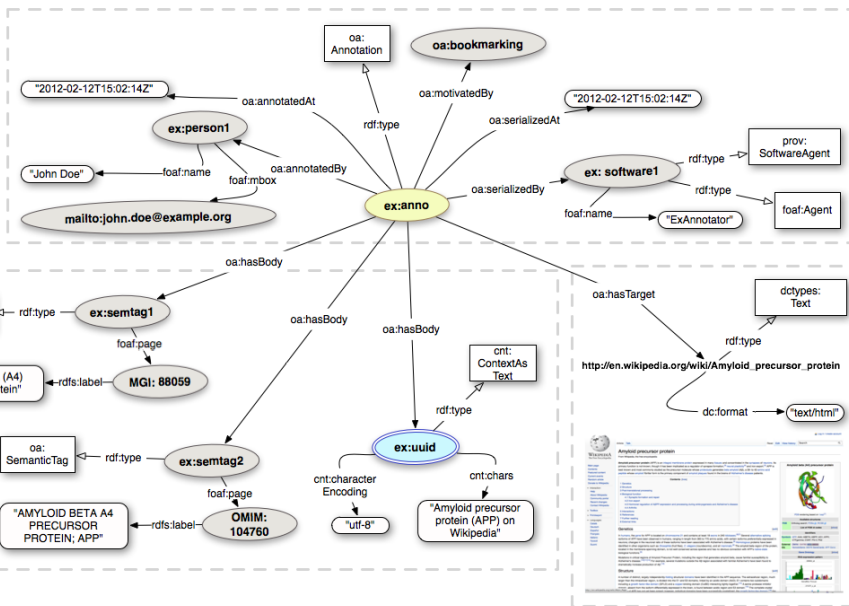

The aim of this research is to develop technologies, software and services allowing construction of digital archives supporting document data inclusion and inference from existing documents.

这项研究的目的是开发技术、软件和服务，以便构建数字档案，支持文件数据的包含和现有文件的推理。

Учебный план специальности 01.03.02 Прикладная математика и информатика

1. Общие сведения учебного плана

Сведения по Учебному плану

Профиль подготовки: Математическое и компьютерное моделирование в технике и экономике, методы принятия решений

Сведения о кафедре, разработавшей Учебный план

Кафедра: Математического анализа и дифференциальных уравнений,
Факультет: ИМЭИ.

Сведения о специальности

Квалификация: Бакалавр

Форма обучения: очная

Программа подготовки: прикладн. бакалавриат

Руководители

Проректор по учебной работе: Не распознан

Начальник УМУ: А.И. Вокин

Директор: М.В. Фалалеев

2. Список компетенций

Дисциплина: Б1.В.ДВ.3.1. Технологии программирования

- способность приобретать новые научные и профессиональные знания, используя современные образовательные и информационные технологии (ОПК-2)
- способность критически переосмысливать накопленный опыт, изменять при необходимости вид и характер своей профессиональной деятельности (ПК-3)
- способность к разработке и применению алгоритмических и программных решений в области системного и прикладного программного обеспечения (ПК-7)

3. Список курсов специальности

- Б1.Б.3 «Философия»

Imported time distribution for lecture, seminars, ..., 导入讲座和研讨会的时间分配、

загрузке,

9. Материально-техническое обеспечение дисциплины (модуля)
10. Образовательные технологии
11. Оценочные средства (ОС)

1. Цели и задачи дисциплины (модуля)

Цель преподавания дисциплины «Технологии программирования» является освоение студентами практических навыков в области разработки программного обеспечения на основе современных подходов к проектированию сложных, гетерогенных, распределенных информационных систем. Развитие навыков системного мышления, необходимого для

Used ontologies

- ❑ Friend-of-a-friend (foaf) - agent information: individuals, legal entities, program agents.
- ❑ Provenance (prov) - references between documents.
- ❑ Dublin Core (dc) - edited annotation mark up.
- ❑ DBpedia resource (dbr) – references to instant objects and classes.
- ❑ Schema.org (schema) - Google, Yandex, Yahoo, etc. searchable objects, structural elements.
- ❑ The Bibliographic Ontology (bibo) - literature reference mark up.

Conclusion

A tools (components) for digital archive implementation, which allows to device information systems and document processing services with the following features:

- ❑ load LOD marked up document, extract, store in a graph and index RDF data;
- ❑ retrieve RDF data as triples or as a result of full-text search query;
- ❑ combine existing LOD data and its content in new documents dynamically with browser based context inference machine;
- ❑ use server-site inference machine (Prolog) to process RDF data upon request from browser' s part of the system;
- ❑ convert created RDFa marked up HTML5 documents into Excel and Word formats.

Applications

- ❑ Document authoring automation;
- ❑ Context-depended editing;
- ❑ Self-organizing global document flows;
- ❑ Documents as data sources for information systems.

Software Platform for Rule-Based Spreadsheet Data Extraction and Transformation

Alexey Shigarov, Vasiliy Khristyuk, et al

shigarov@icc.ru

- ❑ About arbitrary spreadsheet tables
 - ▶ A large volume of valuable data for science and business applications
 - ▶ A big variety of layout, style, and content features
 - ▶ Human-centeredness (incorrect structure and messy content)
 - ▶ No explicit semantics for interpretation by computers

- ❑ Challenges
 - ▶ How to extract tables from worksheets
 - ▶ How to recognize and correct cell structure anomalies
 - ▶ How to recover semantics needed for the automatic interpretation
 - ▶ How to conceptualize extracted data by using external vocabularies

Table understanding includes the following tasks

1. Extraction — detecting a table and recognizing the physical structure of its cells
2. Role analysis — extracting functional data items from cell content
3. Structural analysis — recovering internal relationships between extracted functional data items
4. Interpretation — linking extracted functional data items with external vocabularies (general-purpose or domain-specific ontologies)

Table Object Model

Physical Layer

Cells characterized by layout, style, and content features

Logical Layer

Functional data items and their relationships:

- ❑ entries (values)
- ❑ labels (keys)
- ❑ categories (concepts)
- ❑ entry-label pairs
- ❑ label-label pairs
- ❑ label-category pairs

CRL Grammar

```
rule      = 'rule' <a Java integer literal> 'when' condition
           'then' action 'end' <EOL> {rule} <EOF>
condition = query identifier [':' constraint {',' constraint}
           [',' assignment {',' assignment}]] <EOL> {condition}
constraint = <a Java boolean expr>
assignment = identifier ':' <a valid Java expr>
query       = 'cell' | 'entry' | 'label' | 'category' | 'no cells' |
             'no entries' | 'no labels' | 'no categories'
action      = merge | split | set text | set indent | set mark |
             new entry | new label | add label | set parent |
             set category | group <EOL> {action}
merge       = 'merge' identifier 'with' identifier
split       = 'split' identifier
set text    = 'set text' <a Java string expr> 'to' identifier
set indent  = 'set indent' <a Java integer expr> 'to' identifier
set mark    = 'set mark' <a Java string expr> 'to' identifier
new entry   = 'new entry' identifier ['as' <a Java string expr>]
new label   = 'new label' identifier ['as' <a Java string expr>]
add label   = 'add label' identifier | (<a Java string expr>
             'of' identifier | <a Java string expr>
             'to' identifier
set parent  = 'set parent' identifier 'to' identifier
set category = 'set category' identifier | <a Java string expr>
             'to' identifier
group       = 'group' identifier 'with' identifier
identifier  = <a Java identifier>
```

Cell Cleansing

The actions correct an inaccurate layout and content of a hand-coded table

- ❑ **<merge>** combines two adjacent cells when they share one border
- ❑ **<split>** divides a merged cell that spans n -tiles (row-column intersections) into n -cells
- ❑ **<set text>** modifies a textual content of a cell
- ❑ **<set indent>** modifies a text indentation of a cell

Example

```
when  
  cell corner: cl == 1, rt == 1, blank  
  cell c: cl > corner.cr, rt > corner.rb  
then  
  split c
```

Role Analysis

The actions recover entries and labels as functional data items presented in a table

- ❑ **<set mark>** annotates a cell with a user-defined tag that can be used in subsequent table analysis
- ❑ **<new entry>** (**<new label>**) creates an entry (label) from a cell content with the use of an optional string processing

Example

```
when
  cell corner: cl == 1, rt == 1, blank
  cell c: cl > corner.cr, rt > corner.rb
then
  new entry c
```

Structural Analysis

The actions recover pairs of two kinds: entry-label and label-label

- **<add label>** associates an entry with a label
- **<set parent>** binds two labels as a parent and its child

Example

```
when
  cell c1: cl == 1
  cell c2: cl == 1, rt > c1.rt, indent == c1.indent + 2
  no cells: cl == 1, rt > $c1.rt, rt < $c2.rt, indent == $c1.indent
then
  set parent c1.label to c2.label
```

The actions serve to recover label-category pairs

- **<set category>** associates a label with a category
- **<group>** places two labels to one group that can be considered as an undefined category

Example

```
when
  label l1: cell.mark == " stub"
  label l2: cell.mark == " stub" , cell.rt == l1.cell.rt
then
  group l1 with l2
```

Illustrative Example

The transformation of arbitrary tables with the same layout features (a and c) to their canonicalized versions (b and d)

a1	a2
b1	1
b2	2
b3	

a

DATA	A	B
1	a1	b1
2	a1	b2
4	a2	b4
6	a2	b6

b

a1	a2	a3
b1		3
b2	2	NA

c

DATA	A	B
2	a1	b2
3	a2	b3
5	a3	b5
6	a3	b6

d

The ruleset for the cell cleansing (a), role analysis (b, c), structural analysis (d, e), and interpretation (f, g)

a when cell c: c.text.matches("NA")
then set text "" to c

b when cell c: (c1 % 2) == 0, !blank
then new entry c

c when
then new label c

d when
entry e
label l: cell.cr == e.cell.cr
then add label l to e

e when
entry e
label l: cell.rt == e.cell.rt, cell.cl == e.cell.cl - 1
then add label l to e

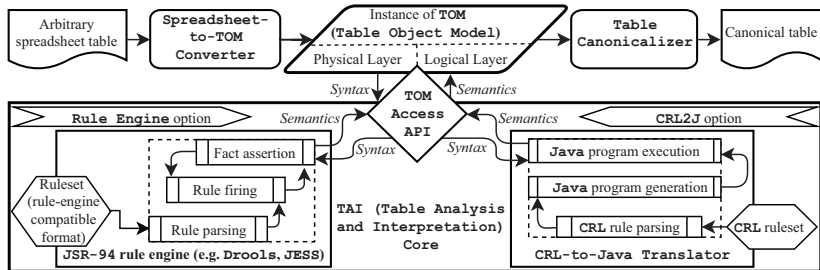

f when label l: cell.rt == 1
then set category "A" to l

g when label l: cell.rt > 1
then set category "B" to l

This example is reproducible at

<https://codeocean.com/capsule/5326436>

Architecture

Two options are provided

Rule Engine option

Executing a ruleset in an appropriate format with a JSR-94 compatible rule engine (e.g. Drools, Jess)

CRL2J option

Translating a ruleset expressed in CRL to an executable Java program

CRL2J Translation

Workflow for generating a Maven-project of a spreadsheet data transformation program

Workflow for translating a CRL ruleset to Java source code

生成电子表格数据转换程序 Maven 项目的工作流程

将 CRL 规则集转换为 Java 源代码的工作流程

CRL2J Translation

In the Workflow

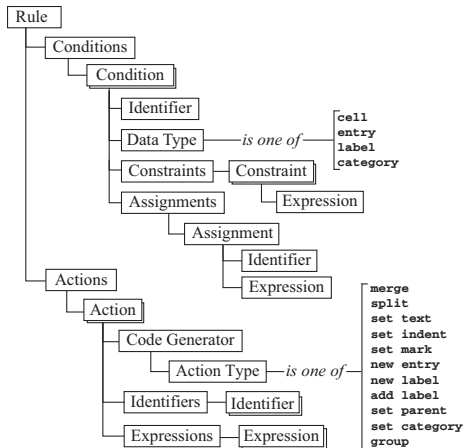

Rule Object Model

在工作流程中

规则对象模型

CRL2J Translation

Example (Source Rule)

```
when
  cell corner: cl == 1, rt == 1, blank
  cell c: cl > corner.cr, rt > corner.rb, ! marked
then
  set mark " @entry" to c
  new entry c
```

Example (Fragment of the Generated Java Code)

```
...
Iterator<CCell> iterator1 = getTable().getCells();
while (iterator1.hasNext()) {
  corner = iterator1.next();
  if ((corner.getCl() == 1) && (corner.getRt() == 1) && ...
    Iterator<CCell> iterator2 = getTable().getCells();
    while (iterator2.hasNext()) {
  ...
```

Example (来源规则)

```
when
  cell corner: cl == 1, rt == 1, blank
  cell c: cl > corner.cr, rt > corner.rb, ! marked
then
  set mark " @entry" to c
  new entry c
```

Example (生成的 Java 代码片段)

```
...
Iterator<CCell> iterator1 = getTable().getCells();
while (iterator1.hasNext()) {
  corner = iterator1.next();
  if ((corner.getCl() == 1) && (corner.getRt() == 1) && ...
    Iterator<CCell> iterator2 = getTable().getCells();
    while (iterator2.hasNext()) {
  ...
```

Performance Evaluation

The results of the transformation of 200 tables of Troy200 dataset

Metrics	Role analysis		Structural analysis	
	Type of instances			
	entries	labels	entry-label pairs	label-label pairs
Recall	0.9813 $\frac{16602}{16918}$	0.9965 $\frac{4842}{4859}$	0.9773 $\frac{34270}{35066}$	0.9389 $\frac{1951}{2078}$
Precision	0.9996 $\frac{16602}{16609}$	0.9364 $\frac{4842}{5171}$	0.9965 $\frac{34270}{34389}$	0.9784 $\frac{1951}{1994}$
F-score	0.9904	0.9655	0.9868	0.9582

Metrics

$$\text{recall} = \frac{|R \cap S|}{|S|} \quad \text{precision} = \frac{|R \cap S|}{|R|}$$

S is a set of instances in a source table, R is a set of instances in its canonical form

All data and steps to reproduce the results are available at <http://dx.doi.org/10.17632/ydcr7mcrtip.5>

Troy200 数据集 200 个表格的转换结果

衡量标准	角色分析		结构分析

Performance Evaluation

The comparison of the running time by using TabbyXL with three different options for transforming 200 tables of Troy200 dataset

Running time of	CRL2J	Drools	Jess
Ruleset preparation (t_1)	2108 [*] ms	1711 [†] ms	432 [†] ms
Ruleset execution (t_2)	367 ^{**} ms	1974 [‡] ms	4149 [‡] ms

^{*} t_1 — a time of parsing and compiling the original ruleset into a Java program

^{**} t_2 — a time of executing the generated Java program

[†] t_1 — a time of parsing the original ruleset and adding the result into a rule engine session

[‡] t_2 — a time of asserting facts into the working memory and matching rules against the facts

For testing, we used 3.2 GHz 4-core CPU

使用 TabbyXL 对 Troy200 数据集的 200 张表格进行转换时，三种不同选项的运行时间比较

运行时间	CRL2J	Drools	Jess
规则集准备 (t_1)	2108 [*] ms	1711 [†] ms	432 [†] ms
规则集执行 (t_2)	367 ^{**} ms	1974 [‡] ms	4149 [‡] ms

^{*} t_1 — 解析原始规则集并将其编译成 Java 程序的时间

^{**} t_2 — 执行生成的 Java 程序的时间

[†] t_1 — 解析原始规则集并将结果添加到规则引擎会话的时间

[‡] t_2 — 在工作记忆中断言事实并将规则与事实相匹配的时间

在测试中，我们使用了主频为 3.2 GHz 的 4 核 CPU

Comparison with Others

Role Analysis

- ❑ Contest task: The segmentation of a table into typical functional cell regions
- ❑ Testing dataset: Troy200
- ❑ Contestant: MIPS (TANGO)
- ❑ Accuracy: MIPS (TANGO) — 0.9899 vs. TabbyXL — 0.9950

Structural Analysis

- ❑ Contest task: The extraction of header hierarchies from tables
- ❑ Testing dataset: A random subset of SAUS^a
- ❑ Contestant: Senbazuru
- ❑ F -score: Senbazuru — 0.8860 vs. TabbyXL — 0.8657

Conclusions & Further Work

- ❑ Impact on software development for spreadsheet data management
 - ▶ Table object model associating functional roles with data items
 - ▶ Table analysis and interpretation driven by user-defined rules
 - ▶ Formulated actions to recover missing semantics of arbitrary tables
 - ▶ Translation of rules to executable spreadsheet transformation programs
- ❑ Limitations
 - ▶ The inaccurate cell structure prevents the table analysis
 - ▶ The very limited interpretation (without external vocabularies)
- ❑ Further work
 - ▶ Rearrangement of cell structure by using visual (human-readable) cells
 - ▶ Detecting derived data by spreadsheet formulas
 - ▶ Enriching the table analysis by named entity recognition
 - ▶ Linking extracted data items with LOD cloud

- ❑ 对电子表格数据管理软件开发的影响
 - ▶ 将功能角色与数据项关联起来的表对象模型
 - ▶ 根据用户定义的规则进行表格分析和解释
 - ▶ 为恢复任意表的缺失语义而制定的行动
 - ▶ 将规则转化为可执行的电子表格转换程序
- ❑ 局限性
 - ▶ 不准确的单元格结构妨碍了表格分析
 - ▶ 非常有限的解释（没有外部词汇表）
- ❑ 进一步的工作
 - ▶ 利用可视（人类可读）细胞重新排列细胞结构
 - ▶ 通过电子表格公式检测派生数据
 - ▶ 通过命名实体识别丰富表格分析
 - ▶ 将提取的数据项与 LOD 云连接起来

但这并不是全部 ...

Domain Knowledge Graphs Induction from Tables

Tables are the most available sources of information. They are valuable data sources for Knowledge Bases (KB)

Knowledge Base Construction Populating with document and structured table extracted data

Knowledge Base Population Populating with recognized new facts on entities from big text corpses

Knowledge base Augmentation Populating with relations with table data.

1. (Ré, 2014) Ré C., et al. Feature engineering for knowledge base construction. IEEE Data Eng. Bull., 37, 26–40, (2014).
2. (Balog, 2018) Balog K. Populating knowledge bases. Entity-Oriented Search. INRE, 39, 189–222, (2018).
3. (Zhang & Balog, 2020) Zhang S. & Balog K. Web table extraction, retrieval, and augmentation: A survey. ACM Trans. Intell. Syst. Technol., 11, (2020).

表格是最常用的信息来源。它们是知识库（KB）的重要数据源

知识库建设 填充文件和结构化表格提取的数据

知识库人口 从大文本尸体中填充关于实体的公认新事实

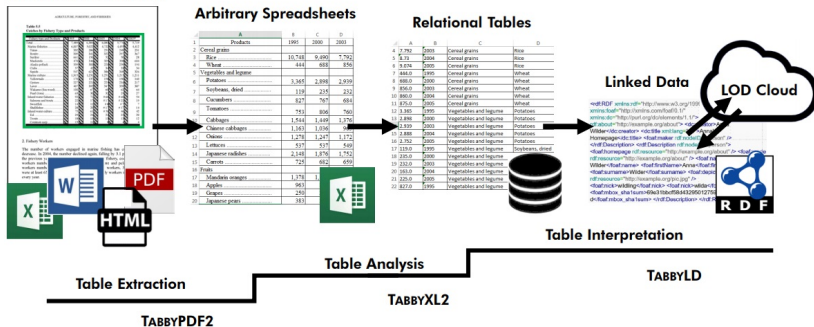

知识库扩充 用表格数据填充关系

1. (Ré, 2014) Ré C., et al. Feature engineering for knowledge base construction. IEEE Data Eng. Bull., 37, 26–40, (2014).
2. (Balog, 2018) Balog K. Populating knowledge bases. Entity-Oriented Search. INRE, 39, 189–222, (2018).
3. (Zhang & Balog, 2020) Zhang S. & Balog K. Web table extraction, retrieval, and augmentation: A survey. ACM Trans. Intell. Syst. Technol., 11, (2020).

自动释表

自动表格解释有三个主要阶段 (Shigarov, 2017)

Weakly- and Semi-Structured Documents

1. (Shigarov, 2017) Shigarov A., Mikhailov A. Rule-based spreadsheet data transformation from arbitrary to relational tables. Information Systems, 71, 123-136 (2017).

Semantic Table Interpretation

Semantic interpretation (Annotation) of tables (Semantic Table Interpretation, STI) is a recognition of mutual and external relations between elements of table content. Externals relate to an enterprise KG and/or a global KG (e.g. DBpedia.org).

- ❑ Cell-Entity Annotation (CEA)
- ❑ Column-Type Annotation (CTA)
- ❑ Column Property Annotation (CPA)
- ❑ Topic Annotation

The diagram shows a table of ATP rankings with various semantic annotations. A blue box labeled 'Topic annotation' points to the entire table. A red box labeled 'CEA' points to the cell containing 'Daniil Medvedev'. A green box labeled 'CPA' points to the first four columns (Rank, Flag, Name, Country). A red box labeled 'CTA' points to the 'Country' column. A green box labeled 'dbo:rankingsSingles' points to the first three columns. A red box labeled 'dbo:Country' points to the 'Country' column.

1		Carlos Alcaraz	Spain	7,420	▲ 1
2		Novak Djokovic	Serbia	7,160	▼ 1
3		Stefanos Tsitsipas	Greece	5,770	—
4		Casper Ruud	Norway	5,560	—
5		Daniil Medvedev	Russia	4,330	▲ 1
6		Félix Auger-Aliassime	Canada	3,415	▲ 4
7		Andrey Rublev	Russia	3,390	—

Semantic Table Interpretation

表格的语义解释（注释）(Semantic Table Interpretation, STI)
是对表格内容元素之间相互关系和外部关系的一种确认。
外部关系涉及企业 KG
和/或全局 KG (例如 DBPedia.org)。

- ❑ 细胞实体注释 (CEA)
- ❑ 列式注释 (CTA)
- ❑ 列属性注释 (CPA)
- ❑ 主题注释

1		Carlos Alcaraz	Spain	7,420	▲ 1
2		Novak Djokovic	Serbia	7,160	▼ 1
3		Stefanos Tsitsipas	Greece	5,770	—
4		Casper Ruud	Norway	5,560	—
5		Daniil Medvedev	Russia	4,330	▲ 1
6		Félix Auger-Aliassime	Canada	3,415	▲ 4
7		Andrey Rublev	Russia	3,390	—

Cell-Entity Annotation

CEA comprises the sequential steps as follows:

1. Select a candidate entity set from DBpedia.org for each value of a cell via SPARQL endpoint and DBpedia lookup.
2. Disambiguation

A SPARQL-query matching words of a phrase.

```
SELECT DISTINCT (str(?subject) as ?subject)
WHERE {
  ?subject a ?type .
  ?subject rdfs:label ?label .
  ?label <bif:contains> ".*%value1*." AND ".*%value2*." ... .
  FILTER NOT EXISTS { ?subject dbo:wikiPageRedirects ?r2 } .
  FILTER (!strstarts(str(?subject), " http://dbpedia.org/resource/Category:" )) .
  FILTER (!strstarts(str(?subject), " http://dbpedia.org/property/" )) .
  FILTER (!strstarts(str(?subject), " http://dbpedia.org/ontology/" )) .
  FILTER (strstarts(str(?type), " http://dbpedia.org/ontology/" )) .
  FILTER (lang(?label) = " en" )
}
ORDER BY ASC(strlen(?label))
LIMIT 100
```

细胞实体注释

CEA 包括以下三个连续步骤：

1. 通过 SPARQL 端点和 DBPedia 查找，为单元格的每个值从 DBPedia.org 中选择一个候选实体集。

2. 消歧义

匹配短语单词的 SPARQL 查询。

```
SELECT DISTINCT (str(?subject) as ?subject)
WHERE {
  ?subject a ?type .
  ?subject rdfs:label ?label .
  ?label <bif:contains> ".*%value1*." AND ".*%value2*." ... .
  FILTER NOT EXISTS { ?subject dbo:wikiPageRedirects ?r2 } .
  FILTER (!strstarts(str(?subject), " http://dbpedia.org/resource/Category:" )) .
  FILTER (!strstarts(str(?subject), " http://dbpedia.org/property/" )) .
  FILTER (!strstarts(str(?subject), " http://dbpedia.org/ontology/" )) .
  FILTER (strstarts(str(?type), " http://dbpedia.org/ontology/" )) .
  FILTER (lang(?label) = " en" )
}
ORDER BY ASC(strlen(?label))
LIMIT 100
```

Evaluation on Test Table Sets

A well-known precision measurement (accuracy) is used for assessment

$$\text{Accuracy} = \frac{CC}{NC},$$

where CC is the number of the correctly related columns to a categorical entity, and CN is the total number of columns.

Recognition stage	T2Dv2	Tough_Tables	Git-Tables
Stage 2, Atomic column classification	0.994	0.956	0.938
Stage 3, Column entity identification	0.924	–	–

Comparison with analogs

	TAIPAN	Table-Miner+	T2Dv2	Mantis-Table
Column entity identification	0.540	0.871	0.924	0.979

Evaluation on Test Table Sets

采用众所周知的精确测量（精度）进行评估

$$\text{准确性} = \frac{CC}{NC},$$

其中， CC 是与分类实体正确相关的列数， CN 是列的总数。

认可阶段	T2Dv2	Tough_Tables	Git-Tables
第 2 阶段，原子柱分类	0.994	0.956	0.938
第 3 阶段，列实体识别	0.924	–	–

与类似物的比较

	TAIPAN	Table-Miner+	T2Dv2	Mantis-Table
列实体标识	0.540	0.871	0.924	0.979

Knowledge Representation and Reasoning: the PCF-Calculus

The main properties of the language of positively constructed formulas (PCF) and its calculi:

- ❑ PCFs have a large-block structure (tree-like) and consist of only positive quantifiers \exists and \forall
- ❑ the PCF-based calculus have a unique inference rule
- ❑ the proof in the PCF-calculus is organized as a question-answering procedure
- ❑ PCF-calculus is both machine-oriented and human-oriented; it is compatible with heuristics
- ❑ the semantic of the PCF-calculus can be changed without modifying axioms and the inference rule

知识表示与推理：PCF 微积分

正构造公式（PCF）语言及其计算器的主要特性：

- ❑ PCF 具有大块结构（树状），仅由正量词 \exists 和 \forall 组成。
- ❑ 基于 PCF 的微积分有一个唯一的推理规则

- ❑ PCF 微积分中的证明是以问题解答过程的形式组织的
- ❑ PCF 微积分既面向机器，也面向人类；它与启发式方法兼容
- ❑ 可以在不修改公理和推理规则的情况下改变 PCF 微积分的语义

PCF-Based Method for Problem Solving

- ❑ The goal of the team of robot is to transport blocks to the target area
- ❑ Each block can be dragged by two or more robots
- ❑ The current state of the World and the goal of the group are formalized in PCF
- ❑ The PCF-based prover and a selection mechanism produce the optimal joint plan of actions for the team
- ❑ The current plan can be easily modified whenever the state of the World is changed

基于 PCF 的问题解决方法

- ❑ 机器人团队的目标是将积木运送到目标区域
- ❑ 每个积木可由两个或多个机器人拖动
- ❑ 世界的当前状态和小组的目标在 PCF 中形式化为
- ❑ 基于 PCF 的求证器和选择机制为团队生成最优的联合行动计划
- ❑ 只要”世界”的状态发生变化, 就可以轻松修改当前计划

A Master Degree Program. Semantic Technologies and Multiagent Systems

It is a joint effort of Saint-Petersburg Electrotechnical University (LETI), Irkutsk State University, and ISDCT SB RAS. Main subjects.

- ❑ Computation Geometry, Digital Signal Processing, Internet of Things,
- ❑ Semantic web, Semantic web Information System Development,
- ❑ AI Basics, Knowledge representation, Object-oriented Logic Programming,
- ❑ Answer Set Programming (SAT), Natural Language Processing,
- ❑ Machine Learning, Neural Networks, Deep Learning,
- ❑ Multiagent Systems, Optimization with Multiagent Systems.

Started at 2022-09-01.

<https://etu.ru/sveden/education/programs/semanticheskie-tehnologii-i-mnogoagentnye-sistemy-01.04.02.html>

A Master Degree Program. 语义技术与多代理系统

该课程由圣彼得堡电工技术大学（LETI）、伊尔库茨克国立大学（Irkutsk State University）和俄罗斯科学院空间技术研究所（ISDCT SB RAS）联合开设。

主要课题。

- 计算几何、数字信号处理、物联网、
- 语义网、语义网信息系统开发、
- 人工智能基础、知识表示、面向对象逻辑编程、
- 答案集编程 (SAT)、自然语言处理、
- 机器学习、神经网络、深度学习、
- 多代理系统，多代理系统优化。

始于 2022-09-01。

<https://etu.ru/sveden/education/programs/semanticheskie-tehnologii-i-mnogoagentnye-sistemy-01.04.02.html>

Conclusion (the final one)

- ❑ Classic knowledge-based systems are powerful AI tools for solving wide class of recognition problems and synthesis of various kind: source code, data objects, control
- ❑ Contemporary means combine classic and new approaches
- ❑ Less dependent on computational resources (as compared to machine learning)
- ❑ Allow justification of the produced solutions
- ❑ Cover a larger set of tasks
- ❑ Natural for math science, and require higher level of AI education

结论（最后）

- ❑ 经典的基于知识的系统是强大的人工智能工具，
可用于解决广泛的识别问题和各种综合问题：
源代码、数据对象、控制、数据处理、数据分析、数据挖掘。
- ❑ 当代手段结合了经典方法和新方法
- ❑ 较少依赖计算资源（与机器学习相比）
- ❑ 允许对所产生的解决方案进行论证
- ❑ 涵盖更多任务
- ❑ 自然适用于数学科学，需要更高水平的人工智能教育

Thank You!
谢谢大家!
